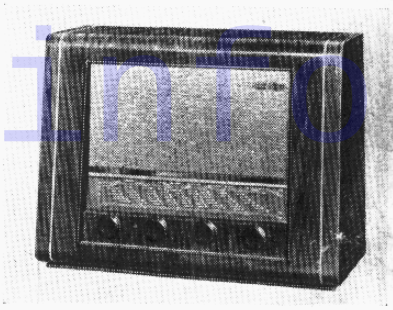
PYE P76

A.C. Table Superhet



Appearance of the Pye P76.

THE Pye P76 is a 4-valve (plus rectifier) 4-band table superhet, designed to operate from A.C. mains of 200-250 V, 50 c/s. In addition to the normal manually operated tone control, it employs a complex negative feed-back tone correction circuit between the A.F. stages. The waveband ranges are 16.5-51.5 m, 65.5-200 m, 183-566 m and 975-1,900 m.

Release date and original price: July, 1953; £19 1s 7d. Purchase tax extra.

COMPONENTS AND VALUES

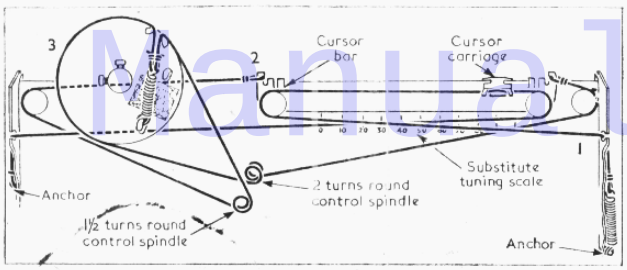
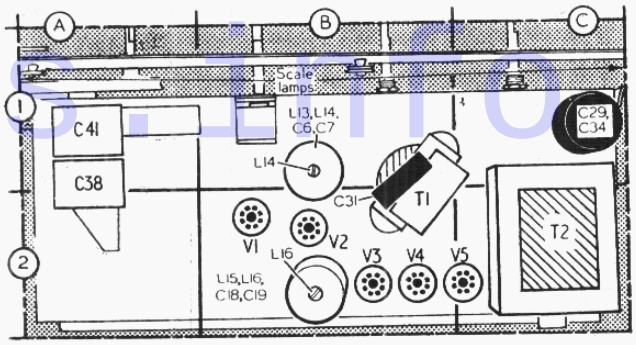
Circuit diagram of the Pye P76. The negative feed-back network **R22, R23, R24, C33, R21, C32** between **T1** secondary winding and **V3** grid circuit gives fixed tone correction and is shunted by the variable tone control circuit **C25, R10. C24** also shunts the network via **S31,** which closes in the gram position of the control.



Above: Sketch of the drive cord system as seen from the rear with gang at minimum.



Right: Plan view of the chassis.

CIRCUIT ALIGNMENT

The chassis must be removed from its cabinet for the following adjustments

I.F. Stages.—Switch receiver to M.W. and turn gang to maximum. Connect output of signal generator, via an 0.1 μF capacitor in the "live" lead, to control grid (pin 6) of **V1** and chassis. Feed in a 470 kc/s (638.3 m) signal and adjust the cores of **L16** (location reference B2), **L15** (F4), **L14** (B1) and **L13** (F3) for maximum output.

R.F. and Oscillator Stages.—As the tuning scale remains fixed to the cabinet when the chassis is withdrawn, reference must be made during the following alignment to the substitute tuning scale printed on the rear of the scale backing plate. With the gang set at maximum, a pencil mark should be made on the cursor bar opposite the zero mark on this scale. This mark may then be used as a cursor line against the substitute scale. Transfer signal generator leads, via a dummy aerial, to **A** and **E** sockets.

L.W.—Switch receiver to L.W., tune to 46 on substitute scale, feed in a 1,400 m (214 kc/s) signal and adjust the cores of **L12** (G4) and **L5** (G4) for maximum output.

M.W.—Switch receiver to M.W., tune to 20 on substitute scale, feed in a 500 m (600 kc/s) signal and adjust the cores of **L11** (G3) and **L4** (G4) for maximum output. Tune to 89.5 on substitute scale, feed in a 200 m (1,500 kc/s) signal and adjust **C40** (G3) and **C37** (G4) for maximum output.

S.W.2.—Switch receiver to S.W.2 ("TB" on waveband indicator), tune to 23 on substitute scale, feed in a 167 m (1.8 Mc/s) signal and adjust the cores of **L10** (F3) and **L3** (F4) for maximum output. Tune to 83 on substitute scale, feed in a 75 m (4 Mc/s) signal and adjust **C36** (G4) for maximum output.

S.W.1.—Switch receiver to S.W.1 ("SW" on waveband indicator), and replace dummy aerial with a 400 Ω series resistor in "live" lead. Tune to 7.5 on substitute scale, feed in a 49.2 m (6.1 Mc/s) signal and adjust the cores of **L9** (F3) and **L2** (F4) for maximum output. Tune to 94 on substitute scale, feed in a 16.85 m (17.8 Mc/s) signal and adjust **C39** (F3) and **C35** (F4).

VALVE ANALYSIS.

Valve voltages and currents in the table (next column) are those derived from the manufacturers' information, and were measured with the receiver tuned to the highest wavelength end of M.W. and operating from A.C. mains of 210 V. Voltages were measured on the 10 V and 250 V ranges of a Model 8 Avometer.

Valve	Anode V	Anode mA	Screen V	Screen mA	Cath. V
V1 ECH42	235	1·8	63	3·6	—
	Oscillator 95	4·3			
V2 EF41	235	4·0	63	1·3	—
V3 EBC41	80	0·5	—	—	—
V4 EL41	254	31·5	235	3·0	6.3
V5 EZ40	250*	—	—	—	268·0†

* A.C. reading, each anode. † Cathode current, 50 mA.

GENERAL NOTES

Switches.—**S1-S31** are the waveband and radio/gram change-over switches ganged in two rotary units beneath the chassis. The units are indicated in our underside view of the chassis, and are shown in detail in the waveband switch diagrams (col. 1) where they are drawn as seen from the front of an inverted chassis. The associated table shows the switch operations. A dash indicates open, and **C**, closed.

Scale lamps.—These are 6.5 V, 0.3 A lamps.

Drive Cord Replacement.—The tuning drive system is unusual in that there is a two-to-one step-up drive on the cursor section, devised by means of an anchored loop to which the cursor is attached. The complete drive consists of three lengths of nylon braided glass yarn, numbered 1, 2 and 3 in the sketch of the drive cord system (col. 1). Cord 1 is 37 inches long, and cords 2 and 3 are both 23 inches long.

Waveband Indicator Drive.—This consists of a length of fine-gauge Bowden cable made up with soldered end loops to measure 8½ inches between the centres of the loops.

To fit a new cord, a knot should be tied in the wire 1 7/16 inch from the centre of one of the end loops. After soldering the knot it should be used to key into the notch provided in the indicator spindle. Starting with the end further from the knot, secure it to the bolt in the waveband spindle bush and wind it clockwise three turns round the bush. Then take the wire up to and one turn clockwise round the indicator spindle, finally anchoring it to the tension spring.

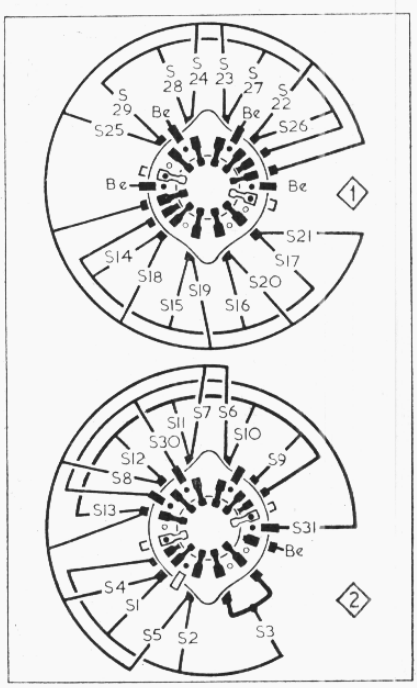

Diagram of the waveband switch units.
