EKCO BAW71

Four - valve, three - waveband battery-operated table model superhet in moulded cabinet. For operation from 2v. accumulator. Made by E. K. Cole, Ltd., Aston Clinton,

Circuit.—A simple transformer, L7 and Ll, forms the S.W. input to Vl, the frequency-changer. On M. and L.W. the input is band-pass. L5 and L6 are the M. and L.W. grid coils respectively, and L2, L3 the corresponding aerial coils. L3 is inductively coupled to the aerial by L1. L2 is capacitively coupled from a tapping via C14 and a switch. L1 is shorted out on S.W.

An image rejector trimmer, T9, is between the aerial side of C14 and L5. C21 is between the top of L3 and the bottom of L6 via a switch.

L2 is trimmed by T5 on the gang condenser aerial section and L3 by a separate trimmer, T8. L5 is trimmed by T4 across the gang grid section and L6 by T7.

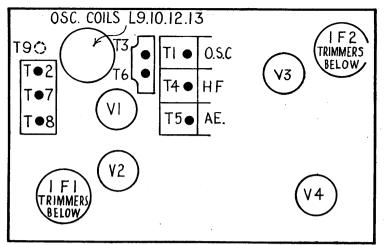

A.V.C. is applied to VI via the grid coils on all three bands, being decoupled by C15 and supplied via R4.

V1 screen is supplied by R1 and decoupled by C16. The oscillator is tuned grid with separate anode reaction coils on each band. The transformers are S.W.: L11 (primary), L8 (secondary); M.W., L12, L9; L.W., L13, L10.

The oscillator anode is decoupled by C17 and the voltage reduced first by R16 and then (for M. and L.W.) by R15. C36 is across R15, C35 provides extra decoupling, and a switch shorts out C36, R15, L12 and L13 on S.W.

The oscillator grid has R17 for an harmonic reducer and R2 for the leak down to L.T.+. The grid condenser C20 leads to the grid coils via a switch The S.W. trimmer is on the gang. Padding is fixed on each band.

A conventional I.F. transformer, with primary connected to full H.T., leads to

Top-of-chassis layout diagram of the Ekco BAW71. showing how the trimmers, valves, and some of the coils are located. The image rejector, T.9, is adjustable from the front of the set.

V2. the I.F. amplifier. The screen of | C38 is a tone condenser between VR1 this is fed by R3 and decoupled by C22. | slider and L.T.-. A.V.C. is applied via the transformer secondary, being supplied by R14 and signal to the primary of the intervalve decoupled by C37.

from V2 anode via C23, the control a Q.P.P. output valve. being developed across R5 and R13, which is returned for delay bias to the former with a tone control (C33 and VR2 junction of R10 and R11, which are in series) between the anodes as well as a between L.T.— and H.T.—. V2 is fixed tone condenser, C30. C29 and C32 controlled from the junction of R5 and

V2 is fed from an H.T. dropper R9. H.T.-, and C31 is an electrolytic across The screens of VI and V2 and the anode the bias potentiometer R10, R11 (the of V3 are also fed via R9.

The signal demodulation diode circuit of V3 is orthodox. R6 with C24 and C25 forms an I.F. filter. R7 is the load, Pertrix 494, Hellesen A230, Everbeing returned to L.T.+. C26 passes the L.F. to VR1, the volume control, cell should be an Exide DMG or GKG5. which obtains bias for the triode section H.T. consumption should be 10 ma and by returning to the R10, R11 junction. L.T., .75 amp.

CIRCUIT DIAGRAM

K. Cole, Ltd., do not L. permit us to publish the circuit diagram of this receiver. However, the circuit description above will enable the engineers to follow the stage-by-stage design, while the tables give the purpose and value of every component. Absence of a circuit should cause no difficulty with the great majority of repairs.

R8 in V3 anode and C28 pass the transformer. This has a centre-tapped The A.V.C. diode of V3 is energised secondary feeding the two sections of V4,

> This has a push-pull output transgo from each anode to chassis.

C39 is between the V4 grids, R12 is a The I.F. transformer in the anode of stabiliser in the common grid return to latter being on the chassis side).

Notes.—A 135 v. H.T. battery is required and may be a Drydex Hills. Ready 53 or Siemens 1314. The 2 v.

An extension speaker should be of 3 R ohms impedance.

GANGING

I.F. Circuits.—Inject 126.5 kcs. to V1 grid and adjust I.F. trimmers for maximum, reducing the input as the coils come into line.

S.W. Band.—See that pointer registers with end of scale, with gang at maximum.

Inject 18 metres, tune to this point and adjust T1. Inject 20 m., tune to this point and adjust T2.

M.W. Band.—Tune to 200 m., inject 1,500 kcs. and adjust T3. Tune to | 17

250 m., inject 1,200 kes. and adjust; WINDINGS T4 and T5.

L.W. Band.—Tune to 1.300 m. Inject 230 kcs. and adjust T6. Then adjust T7 and T8.

Padding is fixed on all bands, but check calibration at the high wavelength ends, readjusting trimming and compromising if necessary.

Image Rejection.—Tune receiver to 747 kcs., inject 1.000 kcs. and adjust T9 for minimum.

Wireless Service Manual

THE Wireless Service Manual, by W. T. Cocking, A.M.I.E.E., has reached its sixth edition. The book has been enlarged—it just tops 300 pages—and in addition to many revisions it has a new chapter on automatic frequency

The book is essentially practical, and assumes that the reader has quite a fair knowledge of the underlying principles of how a set and its component parts operate. The learner should certainly precede, or at least supplement, study of the book with that of another on elementary theory.

Mr. Cocking begins by describing testing equipment, how it should be used and how its indications should be interpreted. Valve testing is dealt with next, and then follow chapters giving symptoms and causes of all the common faults, such as hum, instability, distortion and noise.

Ganging and the causes of whistles are dealt with at some length, and the sections on A.V.C. and A.F.C. are well done. The chapter on television receivers has been retained together with one on the use of cathode-ray test gear. Short-wave sets, speakers and e xtension speakers have individual chapters.

At the end are appendices giving technical reference material, including colour codes and a comprehensive list of British, American and Continental valves and bases. Constructional details of simple test units are reprinted from Wireless World.

Published by Iliffe & Sons, Ltd., at 6s., the volume is available from Odhams Press Technical Book Dept., 92, Long Acre, London, W.C.2, at 6s. 6d. ost
