

MARCONIPHONE

893A

H.M.V. 1351A

Four-valve, plus rectifier and tuning indicator, table model superhet covering three wavebands, with pre-set press-button tuning, and for 200-255v., 25-60 cycle A.C., or D.C. Made by the Gramophone Co., Ltd., and Marconiphone Co., Ltd., Hayes, Middlesex.

Circuit.—High-impedance inductive coupling on all bands links the aerial to V1, the frequency-changer. M. and L.W. coils have iron cores, and the push-buttons switch pre-set condensers across these. In the oscillator section inductive and capacitive coupled circuits are used on M. and S.W., while on L.W. capacity coupling by C18 is used. C28 tunes the push-button oscillator coils.

Permeability-cored I.F. transformers join up V2, the I.F. valve, and V3, the double-diode-triode. V1 is A.V.C. controlled on M. and L.W., and V2 on all bands, the second diode of V3 providing the control in the standard way.

The demodulation diode circuit energises the tuning indicator, V6, and provides a switched pick-up connection. The pick-up is connected through an L.F. transformer which isolates it from the live chassis.

Capacity coupling follows to V4, the output tetrode.

H.T. is obtained on every positive half-wave

through V5, the rectifier, smoothing being by C30, CK1 and C29. The valve heaters are series connected, the current being regulated by a ballast resistance (R27, 28, 29) on an octal base. CK2, CK3 are H.F. chokes.

WAVEBANDS: 16-52, 192-570, 900-2,000 m. Provision is for P.U. (a 7,500 ohms resistance in parallel is recommended) and 4-5 ohm extension speaker. Mains consumption, 100 watts.

GANGING

I.F. CIRCUITS.—Inject 465 kc. to V1 grid and adjust I.F. trimmer condensers for maximum, constantly reducing input.

CALIBRATION.—See that pointer indicates 102 m. with gang at minimum.

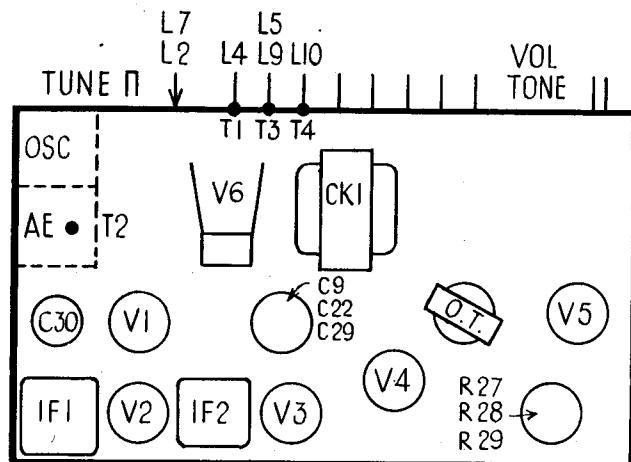

S.W. BAND.—Inject 6 mc. through S.W. dummy aerial device, tune to 50 m., and adjust loops in L7 and L2 for max.

Check that set will tune to 16.8 m. (17.86 mc.).

M.W. BAND.—Tune to 192 m., inject 1,562.5 kc., and adjust T1.

Tune to 220 m., inject 1,363.6 kc., and adjust T2.

Tune to 530 m., inject 566 kc., and adjust cores of L9 and L4.

VALVE READINGS

V.	Type.	Electrode.	Volts.	Ma.
1	X61M	Anode	205	2
		Screen	90	3.7
		Osc. anode	110	6
		Cathode	2.6	11.7

6	Y62	Target	205	3
		Cathode	.8	3

L7 and L2 are the thick coils, L7 being nearer the chassis deck. In the case of L9 and L5, the former is nearer the deck. After any M. and L.W. ganging adjustments, the aerial circuit push-button trimmers must be reset.

Repeat operations.

L.W. BAND.—Tune to 1,000 m., inject 300 kc., adjust T3 and T4.

Tune to 1,750 m., inject 171.4 kc., adjust L10 and L5.

Repeat adjustments.

IMPORTANT.—If adjustments are made to L4 and L5, the aerial push-button trimmers must all be re-adjusted.

PUSH-BUTTONS

Select a suitable button and adjust the adjoining oscillator and aerial trimmers, taking comparisons with manual reception of the station.

Adjustments should be carried out on the customer's aerial and with the set thoroughly warm.
